The Screenshot below shows an error (as seen in red) that might occur when uploading an image for your post.

The Screenshot below explains what to do if the error from the screenshot above occurs

To solve the issue from the screenshot at the beginning of this document, we must delete the storage folder as seen on the left hand side of the screenshot indicated by the orange arrow (**this will also delete the cover_images folder and all the files in it**) and then type in the command "**php artisan storage:link**" in git bash as seen by the orange line where it will then link the storage folder (indicated by the blue line on the left) and all its subfolders and reproduce them in the public folder shown by the green arrow.

You should now be able to submit any image you want and it will store these images in the both storage folders and it will come up in your web browser.

The Public Folder indicated by the green arrow is what allows the images to be generated in the browser which is why we linked the storage folder indicated by the blue arrow to that folder.
